

Relative coastal risk from compound-event count and social vulnerability

Rank	Municipality	Index
1	Guaraqueçaba (PR)	0.332
2	Chaves (PA)	0.305
3	São José do Norte (RS)	0.290
4	Magé (RJ)	0.287
5	Itaboraí (RJ)	0.283
6	São Sebastião (SP)	0.273
7	Paulo Lopes (SC)	0.255
8	Bertioga (SP)	0.254
9	Paraty (RJ)	0.252
10	Guapimirim (RJ)	0.249

Interpretation caveat

The index is relative/comparative.
A municipality can have relevant physical coastal hazards while ranking lower after social vulnerability weighting.

Formula

$Hazard_Index = norm(compound_c)$
 $Risk_Hazard =$
 $(SVI_Coast_2022 / 100) \times Hazard_Index$
